ABSTRACT

A hypertext displaying apparatus is provided. When a
1735   link destination indicated in stored data is designated, a
processing section instructs a transmission/reception section to
download hypertext data at the link destination, and instructs
a history storage section to register an identifier of the
currently-displayed stored data. If a user gives a "previous
1740   content" instruction, the processing section reads from a stored
information storage section the stored data corresponding to the
identifier registered in the history information storage section,
so that the stored data is displayed on a screen.
